

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing Of Claims

Claim 1. (Canceled) An instrument for compacting bone material, said instrument comprising:

a first component defining a longitudinal axis thereof; and

a second component moveably associated with said first component, said second component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component.

Claim 2. (Canceled) The instrument of claim 1, wherein said first component comprises:

a body; and

a stem extending from said body, said second component slidably mounted to said body

Claim 3. (Canceled) The instrument of claim 1, wherein at least one of said first component and said second component is tapered along the longitudinal axis.

Claim 4. (Canceled) The instrument of claim 1:

wherein said first component defines a restraining portion thereof; and

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

wherein said second component defines a cooperating portion for cooperating with the restraining portion of said first component to provide restrained motion of said second component with respect to said first component.

Claim 5. (Canceled) The instrument of claim 1, further comprising a third component moveably associated with said first component, said third component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component.

Claim 6. (Currently amended) An instrument for compacting bone material, said instrument comprising:

a first component defining a longitudinal axis thereof;
and

a second component moveably associated with said first component, said second component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component ~~The instrument of claim 1;~~, wherein one of said first component and said second component defines a void, and wherein said other of said first component and said second component comprises a protrusion for cooperation with the void.

Claim 7. (Original) The instrument of claim 6, wherein the protrusion and the void interlock with each other.

Claim 8. (Canceled) The instrument of claim 1, wherein said second component defines a first surface for cooperation with the first component and a second surface opposed to the first surface for contact with the bone material.

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

Claim 9. (Canceled) The instrument of claim 8, wherein the second surface of said second component is adapted to urge the particles radially from the longitudinal axis as the first component is rotated about the longitudinal axis in a first direction.

Claim 10. (Canceled) The instrument of claim 1, wherein said first component and said second component are adapted to provide for motion of said second component away from the longitudinal axis of said first component as the first component is advanced axially in the direction of the longitudinal axis of said first component with respect to the second component.

Claim 11. (Canceled) An instrument for compacting bone material in a medullary canal of a long bone, said instrument comprising:

a first component defining a longitudinal axis thereof said first component having an outer periphery having portion thereof which is tapered along the longitudinal axis, the portion of the outer periphery of said first component defining a restraining portion thereof; and

a second component moveably associated with said first component, said second component defining a cooperating portion for cooperating with the restraining portion of said first component to provide restrained motion of said second component with respect to said first component.

Claim 12. (Canceled) The instrument of claim 11, wherein said first component comprises:

a body; and

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

a stem extending from said body, said second component slidably mounted to said body

Claim 13. (Canceled) The instrument of claim 11, further comprising a third component moveably associated with said first component, said third component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component.

Claim 14. (Currently amended) ~~The instrument of claim 11; An instrument for compacting bone material in a medullary canal of a long bone, said instrument comprising:~~

a first component defining a longitudinal axis thereof
said first component having an outer periphery having portion
thereof which is tapered along the longitudinal axis, the
portion of the outer periphery of said first component defining
a restraining portion thereof; and

a second component moveably associated with said first
component, said second component defining a cooperating
portion for cooperating with the restraining portion of said
first component to provide restrained motion of said second
component with respect to said first component, wherein one of
said first component and said second component defines a void;
and wherein said other of said first component and said second
component comprises a protrusion for cooperation with the void.

Claim 15. (Original) The instrument of claim 14, wherein the protrusion and the void interlock with each other.

Claim 16. (Canceled) The instrument of claim 11, wherein said second component defines a first surface for cooperation

Serial No. 10/671,820

Amendment dated May 19, 2006

Reply to Office action of February 22, 2006

with the first component and a second surface opposed to the first surface for contact with the bone material.

Claim 17. (Canceled) The instrument of claim 16, wherein the second surface of said second component is adapted to urge the particles radially from the longitudinal axis as the first component is rotated about the longitudinal axis in a first direction.

Claim 18. (Canceled) The instrument of claim 11, wherein said first component and said second component are adapted to provide for motion of said second component away from the longitudinal axis of said first component as the first component is advanced axially in the direction of the longitudinal axis of said first component with respect to the second component.

Claim 19. (Canceled) A method for preparing a cavity in a long bone comprising:

cutting an incision in the patient;
preparing a cavity in a long bone;
providing an instrument for compacting bone material having a first component defining a longitudinal axis thereof and a second component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component;
placing the instrument in the cavity; and
compacting bone material in the cavity.

Claim 20. (New) The instrument of claim 6, wherein said first component comprises:

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

a body; and
a stem extending from said body, said second component
slidably mounted to said body

Claim 21. (New) The instrument of claim 6, wherein at
least one of said first component and said second component is
tapered along the longitudinal axis.

Claim 22. (New) The instrument of claim 6:
wherein said first component defines a restraining portion
thereof; and

wherein said second component defines a cooperating
portion for cooperating with the restraining portion of said
first component to provide restrained motion of said second
component with respect to said first component.

Claim 23. (New) The instrument of claim 6, further
comprising a third component moveably associated with said
first component, said third component moveable at least
partially in a radial direction outwardly from the longitudinal
axis of said first component.

Claim 24. (New) The instrument of claim 6, wherein said
second component defines a first surface for cooperation with
the first component and a second surface opposed to the first
surface for contact with the bone material.

Claim 25. (New) The instrument of claim 24, wherein the
second surface of said second component is adapted to urge the
particles radially from the longitudinal axis as the first

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

component is rotated about the longitudinal axis in a first direction.

Claim 26. (New) The instrument of claim 6, wherein said first component and said second component are adapted to provide for motion of said second component away from the longitudinal axis of said first component as the first component is advanced axially in the direction of the longitudinal axis of said first component with respect to the second component.

Claim 27. (New) The instrument of claim 14, wherein said first component comprises:

a body; and
a stem extending from said body, said second component slidably mounted to said body

Claim 28. (New) The instrument of claim 14, further comprising a third component moveably associated with said first component, said third component moveable at least partially in a radial direction outwardly from the longitudinal axis of said first component.

Claim 29. (New) The instrument of claim 14, wherein said second component defines a first surface for cooperation with the first component and a second surface opposed to the first surface for contact with the bone material.

Claim 30. (New) The instrument of claim 29, wherein the second surface of said second component is adapted to urge the particles radially from the longitudinal axis as the first

Serial No. 10/671,820
Amendment dated May 19, 2006
Reply to Office action of February 22, 2006

component is rotated about the longitudinal axis in a first direction.

Claim 31. (New) The instrument of claim 14, wherein said first component and said second component are adapted to provide for motion of said second component away from the longitudinal axis of said first component as the first component is advanced axially in the direction of the longitudinal axis of said first component with respect to the second component.
